Lift and Shift to the Cloud

1. Select an application or group of applications to move to the cloud.
2. Plan for the migration, considering technical considerations, resource requirements, and legal constraints.
3. Select a cloud service provider and plan the migration of the application to the cloud.
4. Ensure that the application is compatible with cloud services.
5. Test the migration thoroughly in a staging environment to ensure that the application works as expected.
6. Migrate the application to the cloud.
7. Monitor the application post-migration for any issues and resolve them promptly.

Hybrid Cloud

1. Select an application or group of applications to move to the cloud.
2. Plan for the migration, considering technical considerations, resource requirements, and legal constraints.
3. Select a cloud service provider and plan the migration of the application to the cloud.
4. Ensure that the application is compatible with cloud services.
5. Test the migration thoroughly in a staging environment to ensure that the application works as expected.
6. Migrate the application to the cloud.
7. Monitor the application post-migration for any issues and resolve them promptly.

Road to the Cloud

Start Brand New in the Cloud

1. Identify best ways to redesign source systems where possible.
2. Plan, and start cleaning data in the new environment.
3. Gather and prioritize a plan, and start cleaning data in the new environment.
4. Prepare for migration and build a data migration strategy and interception layer.
5. Determine a cutover plan and retirement of the old systems.
6. Determine the modernization strategy.
7. Work with vendors to begin transferring licenses of existing software to the cloud.
8. Migrate data storage to cloud environments.
9. Retire the old systems once approved by stakeholders.
10. Migrate systems to the cloud.

Lift & Shift to the Cloud

1. Identify any existing system that needs to be lifted and shifted.
2. Plan for the migration, considering technical considerations, resource requirements, and legal constraints.
3. Select a cloud service provider and plan the migration of the application to the cloud.
4. Ensure that the application is compatible with cloud services.
5. Test the migration thoroughly in a staging environment to ensure that the application works as expected.
6. Migrate the application to the cloud.
7. Monitor the application post-migration for any issues and resolve them promptly.
